## ABSTRACT

Scientists at Woods Hole routinely collect and analyze a considerable amount of data relating to the oceans of the world. Of the many different kinds of data, one particular subset concerns those events occurring at the sea surface. A large number of sea surface environmental observations have been collected at Woods Hole. These data, and the subsequent analyses generated from the Air/Sea Heat Flux and the Climatology study projects, have been collected and archived. This document describes the W.H.O.I./Climatology and Air/Sea Interaction (WHOI/CASI) data collection and provides an initial index to its various components.

## INTRODUCTION

During the last few years, several researchers at Woods Hole have used the National Climatic Center's Tape Data Family-11 (TDF-11), a collection of world-wide surface marine observations made by ships of opportunity. A variety of studies have been made using these data but the most extensive work has been done by Bunker. A series of related projects have performed a considerable amount of processing on a selected group of atmospheric and sea surface parameters. Energy fluxes and wind stresses have been computed by empirical formulas from those parameters. All the parameters have been averaged over a variety of climatological conditions, areal distributions, and time periods. These data have been assembled to build the Climatology and Air/Sea Interaction (CASI) collection. The information in this data set is available to all marine and atmospheric scientists. This document defines the contents of the WHOI/CASI archives, describes how to access and use the data, and reports on some of the analyses already done.

### I. SURFACE MARINE OBSERVATIONS (TDF-11)

#### I.A Source of the data

The surface marine observations residing at W.H.O.I. have been obtained from the National Climatic Center (NCC) at Asheville, North Carolina. NCC is one of the centers in the Environmental Data and Information Service (EDIS) of NOAA. The major part of the data has been extracted from the Tape Data Family-11 (TDF-11). This data series is in a standardized format used to record observations of the surface marine environment from a wide variety of sources. The NCC data set, from 1854-1968, contains over 31 million observations from all over the world. The NCC is continually adding to this data base, although there is a lag of a couple of years before any group of observations becomes available to the public. If the region or time period of interest is not available in the W.H.O.I. collection, it may be obtained from the regional NOAA representative or directly from the National Climatic Center. We will make an effort to merge future W.H.O.I. users' acquisitions into the archive if they desire.

### I.A.1 TDF-11 data content

Because the TDF-11 has been assembled from a variety of sources, there is available no uniform set of selected parameters. In general, only the data present in characters 1-72 of each record are available in sufficient enough quantity to be useful. These parameters are summarized in Table I. The last part of each record is apt to contain a wide variety of supplemental data whose content must be determined from a flag field. Appendix A gives a more complete description of the TDF-11 data content.

### I.A.2 TDF-11 data format

Most of the TDF-11 series obtained from the National Climatic Center is stored on 9-track, 800 bpi, magnetic tape. The data are usually stored as 140 character (byte), EBCDIC, blocked logical records. The blocking factor may vary from 1 to 40; the NCC label on the reel will give the blocking factor. The records are ordered by the 10° square Marsden reference number. Within a 10° square the observations are usually ordered chronologically by year, and within the year, by month. A tape may contain data for one or more 10° squares. In general, there is no end-of-file mark between data from separate 10° squares. It has also been found that there is not always an end-of-file mark before an end-of-tape signal.

Table I also summarizes the location of the more frequently used parameters within the record. Many of these fields contain additional information in the form of a logical byte addition, or "overpunch". This technique is used by the NCC to carry information such as minus signs. Users of the TDF-11 tapes are encouraged to first read the detailed format description contained in Appendix A, or documentation obtained from the National Climatic Center.

## I.B TDF-11 coverage

### I.B.1 Spatial coverage

The TDF-11 series is arranged by areas 10 degrees square. As these are marine observations only, many areas will contain large areas of land, and thus represent only a relatively small area of sea surface. The subset of the TDF-11 series available at W.H.O.I. covers most of the Atlantic and Indian Oceans, the Mediterranean and the Red Seas, and selected regions of the Pacific. Figure 1 illustrates the spatial coverage of the current collection.

Within any single 10° square the spatial coverage may vary considerably. Observations are generally confined to the established shipping lanes. A finer resolution of position may be obtained from the data records, either from the 1° subsquare Marsden reference number, or from the latitude/longitude coordinates (0.1 degree). The WHOI/CASI collection also contains marine observations recorded from "stationary" weather ships. These are recorded separately and have not been merged into ship-of-opportunity files. These files are in TDF-11 format, ordered chronologically by year and month, but not by 10° squares.

### I.B.2 Temporal coverage

Observations of the marine surface conditions date from 1854 in some regions of the world. However, coverage in the early years tended to be infrequent. The frequency of observations varies widely over the ocean surface. Local, as well as global, events in the economic and political environment have a large influence on the recorded observation rate for any given area. Thus, both World Wars saw a marked increase in the rate of observation. The closing of the Suez Canal produced a drop in the rate of observation in the Red Sea, and the advent of large oil tankers produced an increased rate of observation around the Cape of Good Hope.

For most regions in the WHOI/CASI collection, the time range is commonly from 1942 to 1972. (Supplementary tapes have been obtained to update the record through 1976. These have not been appended to the existing series, but are grouped separately. See the TDF-11 tape index for tape identifiers and Marsden square ranges covered by these updates.) The index to the W.H.O.I. TDF-11 series (see section I.C.1 below) contains a time range for the observations on a tape. This range has been determined from several sources and represents the earliest and latest dates revealed using the various processing programs. It does not necessarily represent the full range of time.

#### I.C W.H.O.I. TDF-11 storage and access

An effort has been made to gather the W.H.O.I. TDF-11 series into a central storage facility. Most tapes are currently located in tape racks in room 358, Clark Laboratory. There does not exist any formal system for accessing the data. Users are requested to take only those tapes needed and to return them as soon as possible. A withdrawal form is located near by; please supply the tape identifier, your name, telephone extension, date of tape withdrawal, and date of return. For cases where only a small number of tapes, or portions of tapes, are needed, users may wish to copy the TDF-11 tapes to their own tapes or disc files. This procedure will increase the life of the TDF-11 tapes as well as make them more readily available to others.

##### I.C.1 Index to W.H.O.I. TDF-11 collection

Located in room 358 along with the data tapes is an index of the data in the W.H.O.I. TDF-11 collection. The data are cross-referenced in two ways: 1) the first index lists the data by Marsden reference number. This is, for most purposes, identical to being ordered by latitude and longitude. 2) The second index lists the data by magnetic tape identifier. As these tapes were labelled in the order in which they were received, there is no reliable method of identifying the data from the tape identifier. This index is used as an aid in determining what else is on the tape.

In addition to the Marsden reference number and tape identifier, the following data are available from the index (an example is shown in Figure 2):

- Position: The position is expressed as the latitude and longitude of the center point of the  $10^{\circ}$  square. Latitudes contain the suffix N or S to denote hemisphere and the longitudes are suffixed with E or W with respect to the Greenwich Prime Meridian.
- Storage location: The location where the data are stored. Some investigators may choose to keep custody of their tapes while still making the data available through the WHOI/CASI archive. These tapes should be obtained from the associated investigator.
- Investigator: Identifies the contributor of the data tape. This person may be able to answer questions pertaining to the contents of the tape, or may have information bearing on your current project.
- Start and End Dates: An attempt has been made to estimate the temporal range of the data contained on the tape. These figures have been obtained as a by-product from previous processing efforts rather than from any specific search. The dates are in no way connected with the frequency of observations, and should be used only as a rough guide to the range. (Any new values encountered by users will be incorporated if made available to the authors.)
- Number of observations: In some cases a rough estimate of the number of observations has been provided. Again, these figures have been obtained as a by-product of other work and are merely an estimate.

### I.C.2 Additions to W.H.O.I. TDF-11 collection

It is hoped the W.H.O.I. TDF-11 collection will meet some of the need for obtaining oceanographic data quickly. If the desired TDF-11 data is not present in the archive, it must be obtained from the Nation Climatic Center. The NOAA representative at Woods Hole can aid you in obtaining these data. The subsequent addition of TDF-11 data to the W.H.O.I. collection would be welcome. Also, any information which would update the index, and make it more useful to others, would be appreciated.

### I.D Using the W.H.O.I. TDF-11 observations

The TDF-11 data series represents a great many observations over a considerable span of time. As such, the observations may be used for constructing time series of events, such as monsoons, as well as for looking at long term (25 and 100 years) climatic trends. Most observations have been made by ships of opportunity; Fieux and Stommel (1) have discussed the accuracy of these observations in representing the environment. In general, the sheer quantity of observations makes the data suitable for most projects where average results are desired.

While the National Climatic Center has made an attempt to validate all the observations, users are cautioned to perform their own reasonability tests before or during processing. Instances have been recorded where temperature has not been converted from Fahrenheit to Celsius. Other discrepancies, although also rare, have been found in almost all other parameters. For this reason, and because of the involved format of the data, no general access programs have been written for the TDF-11 series at W.H.O.I. The large number of parameters per record and the use of the "overpunch" make it more efficient for users to interpret only those fields necessary to their studies. The format is adequately described in Appendix A and IPC personnel can provide aid in decoding the records if necessary. It is further recommended that the user list a few records of a tape to aid in the interpretation of the format and in program development.

## II. AIR/SEA HEAT FLUX ANALYSIS (PROGRAM ASHFLA)

In 1973 Andrew Bunker initiated a study of the energy fluxes at the air/sea interface. This study used observations from the Tape Data Family-11 (TDF-11) series to compute a variety of climatological averages for environmental parameters as well as for the energy fluxes. The results of this project have been incorporated into the WHOI/CASI files as the ASHFLA component.

### II.A Background for ASHFLA

The ASHFLA program was developed to study the mechanism of energy transport between the ocean surface and the atmosphere. Over the course of the project the analysis procedure was occasionally changed to incorporate information learned in earlier processing stages. These changes included a) the effect of sea ice on the albedo, b) the effects of clouds on the incoming and long wave radiation, c) changes in the parameters used and summarized, and d) changes in units (SI) associated with the computed parameters. In most cases the changes have not affected the results which are incorporated into the WHOI/CASI files. The climate study (see Section III below) which ensued from the heat flux project has further standardized that portion of the ASHFLA files which it utilized.

The project generated an abundance of data, which will be discussed in the following sections. ASHFLA data are stored in volumes of computer printout. An interpretation of at least portions of the data has been published by Bunker (2, 3, 4).

#### II.A.1 Heat flux spatial coverage

The ASHFLA program initially studied a small region of the western North Atlantic Ocean. The study was gradually enlarged to cover all of the North Atlantic, most of the South Atlantic and Indian Oceans, the Mediterranean and Red Seas. Studies have also been made, based on the contribution of TDF-11 data from other projects, for parts of the Pacific and Southern

Oceans. Figure 3 shows those areas covered by the heat flux study. The study was conducted on areas  $10^\circ$  square. There was also the capability to subdivide the area into from 1 to 10 regions based on  $1^\circ$  squares.

#### II.A.2 Temporal coverage of heat flux files

As the heat flux study was derived from the TDF-11 series, the time range was primarily a function of the available data. A further constraint was imposed by the reasonability checking done on each observation (see Section II.B). Heat fluxes were computed for individual  $10^\circ$  squares starting anywhere from the 1920's to the 1950's; ending dates were from the late 1960's to 1973 or 1974. The time range for a selected  $10^\circ$  square region is best obtained from the summary of monthly averages near the beginning of each volume. The temporal resolution of the study was one month using a standard 30-day month for some of the annual averages.

#### II.B Parameters studied in heat flux program

As mentioned earlier, the study of the heat flux at the air/sea interface evolved through a number of different stages. In the outline which follows, reference is made to the latest version of the study and computer program under which the bulk of the data were processed. Table II shows those parameters in the TDF-11 series which were used in the study.

##### II.B.1 Input parameter acceptability

The reasonability of the observational data was tested before any heat flux computations were performed. The data were broken down into two classes; variables critical to the heat flux computations must have satisfied the reasonability check. Those variables not as crucial were assigned a default value if the acceptability condition was unsatisfied.

a. All of the following variables, in addition to being reported, had to satisfy the reasonability conditions ascribed below.

- i Wind Speed,  $W$  in knots  
 $0 \leq W \leq 199$  knots
- ii Air Temperature,  $T_a$  in  $^{\circ}\text{C}$   
 $-40.0^{\circ} \leq T_a \leq 45.0^{\circ}\text{C}$
- iii Dew Point Temperature,  $T_d$  in  $^{\circ}\text{C}$   
 $-70.0^{\circ}\text{C} \leq T_d \leq 40.0^{\circ}\text{C}$   
 $(T_a - T_d) \geq 0.1^{\circ}\text{C}$
- iv Sea Surface Temperature,  $T_s$  in  $^{\circ}\text{C}$   
 $-5.0^{\circ}\text{C} \leq T_s \leq 40.0^{\circ}\text{C}$
- v Air-Sea Temperature Difference,  $T_{as}$  in  $^{\circ}\text{C}$   
 $-40.0^{\circ} \leq T_{as} \leq 20.0^{\circ}\text{C}$   
 $|T_{as} - (T_a - T_s)| \leq 1.0^{\circ}\text{C}$
- vi Pressure,  $P$  in millibars  
 $890.0 \leq P \leq 1070.0$  mb
- vii Total Cloud Amount,  $N_T$  in oktas  
 $N_T \leq 8$   
 if  $N_T > 8$  then  $N_T = 8$

b. If the following variables were missing or did not satisfy the acceptability requirements, they were assigned the stated value.

- i Lower Cloud Amount,  $N_L$  in oktas  
 If  $N_L = \text{blank}$   $N_L = 0$  oktas  
 If  $N_L > 8$  oktas  $N_L = 8$  oktas
- ii Present Weather Code,  $W_c$   
 If the present weather code was left blank, a no rain state was assumed. The following weather codes (from Appendix A) were taken to indicate rain, or more correctly, precipitation.  
 $14 \leq W_c \leq 29$   
 $50 \leq W_c \leq 99$

## II.B.2 Equations and quantities calculated

The item of primary interest was the net heat flux between the sea surface and the atmosphere. In the study the net flux comprised the latent, sensible, and radiational flux contributions. Each of these terms has additional measures associated with it; this section describes the mathematical expressions used.

- a. Calculation of net heat gain by the ocean,  $A$  in  $\frac{\text{watts}}{\text{meter}^2}$

$$A = R - LE - S$$

where  $R$  is radiational exchange at ocean surface

$LE$  is latent heat flux

$S$  is sensible heat flux

The quantity  $A(B) = R_B - LE_B - S_B$  is calculated using Budyko's method, which assumes a constant exchange coefficient. (See h below.) An additional quantity  $A(B,I)$  is calculated which uses the Budyko calculated radiational exchange and average fluxes based on individual observations as indicated in c and d below:

$$A(B,I) = R_B - LE_I - S_I$$

- b. General terms

- i Absolute air temperature,  $\theta_a$  in °Kelvin

$$\theta_a = 273.16 + T_a$$

- ii Absolute sea surface temperature,  $\theta_s$  in °Kelvin

$$\theta_s = 273.16 + T_s$$

- iii Absolute dew point temperature,  $\theta_d$  in °Kelvin

$$\theta_d = 273.16 + T_d$$

- iv Pressure,  $P$ , converted to Pascals

- v Vapor pressure of air,  $e_a$ , Pascals

$$\log_{10} e_a = 10.42926609 - 1.82717843 \left( \frac{1000.0}{\theta_d} \right) - 0.071208271 \left( \frac{1000.0}{\theta_d} \right)^2$$

- vi See Reference 6

Vapor pressure over sea,  $e_s$ , Pascals

$$\log_{10} e_s = 10.42926609 - 1.82717843 \left( \frac{1000.0}{\theta_s} \right) - 0.071208271 \left( \frac{1000.0}{\theta_s} \right)^2 - 0.008774$$

- vii Mixing ratio of air,  $q_a$  in grams/gram

$$q_a = \frac{0.622 e_a}{P - e_a}$$

- viii Mixing ratio over sea,  $q_s$  in grams/gram

$$q_s = \frac{0.622 e_s}{P - e_s}$$

- ix Virtual temperature,  $T_v$  in °Kelvin

$$T_v = \theta_a \cdot (1.0 + 0.61 q_a)$$

- x Density of air at the surface,  $\rho$  in kilogram/meter<sup>3</sup>

$$\rho = \frac{P}{T_v \left( 287.04 \frac{\text{Joules}}{\text{kg} \cdot ^\circ\text{K}} \right)}$$

- xi X component of wind velocity,  $U$  in  $\frac{\text{meters}}{\text{seconds}}$

$$X = W \cos[270^\circ - f(D_1, D_2)]$$

where  $f(D_1, D_2)$  is the direction from which the wind is blowing.

See Table III.

xii Y component of wind velocity, V in  $\frac{\text{meters}}{\text{second}}$

$$Y = W \sin[270^\circ - f(D_1, D_2)]$$

where  $f(D_1, D_2)$  is the direction from which the wind is blowing.

See Table III.

xiii Mean direction of resultant wind, MD in degrees

$$MD = 270.0 - \tan^{-1} V/U$$

c. Sensible heat flux, S in  $\frac{\text{watts}}{\text{m}^2}$

$$S = -T_{as} \rho W C_p C_e$$

where  $C_p$  = specific heat of dry air =  $1004.64 \frac{\text{Joules}}{\text{Kg}^\circ\text{Kelvin}}$

and  $C_e = f(W, T_{as})$ . See Table IV.

d. Latent heat flux, LE in  $\frac{\text{watts}}{\text{m}^2}$

$$LE = L \rho W C_e (q_s - q_a)$$

where  $L = 2500297.8 \frac{\text{J}}{\text{kg}} - T_a \cdot 2365.09 \frac{\text{J}}{\text{kg}^\circ\text{C}}$

and  $C_e = f(W, T_{as})$ . See Table IV.

e. Radiational exchange at ocean surface, R in  $\frac{\text{watts}}{\text{meter}^2}$

$$R = Q(1.0 - \alpha) - I_R$$

where  $Q$  = solar radiation received at the surface (see II.B.2.h.iii below),

$I_R$  = effective infra-red radiation of ocean,

$\alpha$  = a function of the albedo  $[f(m, \phi)]$  from Table V.

- f. Effective infra-red radiation emitted by ocean surface,  $I_R$  in  $\frac{\text{watts}}{\text{meter}^2}$

$$I_R = B\sigma \theta_a^4 (11.7 - 0.0023e_a) \cdot \left(1 - \frac{C \cdot N_T}{8.0}\right) + 4B\sigma \theta_a^3 (\theta_s - \theta_a)$$

where  $B$  = fraction of black body radiation, 0.96

$\sigma$  = Stefan Boltzmann's constant (Budyko's modified value)  
 $1.3134 \times 10^{-9} \frac{\text{W}}{\text{m}^2 \text{ } ^\circ\text{K}^4}$

$C = f(\phi)$  the cloud cover coefficient. See Table VI.

- g. Momentum between atmosphere and ocean,  $\tau$  in Pascals

$$\tau = \rho C_D W^2$$

where  $C_D = f(W, T_{as})$ . See Table VII.

This is broken down into components in the following manner:

$$\tau_X = \tau \cdot \cos[270 - f(D_1, D_2)]$$

$$\tau_Y = \tau \cdot \sin[270 - f(D_1, D_2)]$$

where  $f(D_1, D_2)$  is the direction from which the wind is blowing.  
 See Table III.

- h. Budyko equations (see Reference 7)

In calculating the heat flux terms using Budyko's coefficient, average values for the time period were used for all the general variables.

The specific changes in the equations are noted below.

- i Sensible heat flux,  $S_B$  in  $\text{watts}/\text{meter}^2$

In section II.B.2.c, the exchange coefficient  $C_E$  is replaced by the value 0.0021.

- ii Latent heat flux,  $LE_B$  in  $\text{watts}/\text{meter}^2$

In section II.B.2.d, the exchange coefficient  $C_E$  is replaced by the value 0.0021.

iii Solar radiation received at the surface,  $Q$  in watts/meter<sup>2</sup>

- a) The calculation of  $Q_0$ ,  $Q_0 = f(m, \phi)$ , is a function of the latitude and time.  $Q_0$  for a monthly calculation is given in Tables VIIIa and b.
- b) The calculation used in the determination of the surface solar radiation II.B.2.e, is as follows.

$$Q = Q_0 \left( 1.0 - \frac{A_c \bar{N}_T}{8.0} - B_c \left( \frac{\bar{N}_T}{8.0} \right)^2 \right)$$

where  $A_c = f(\phi)$ , is the cloud cover coefficient. See Table IX.

$B_c = f(\phi)$ , and is set = 0.38 .

Average values are used for the total cloud cover.

- iv The average albedo for all observations replaces the table value in II.B.2.e.

## II.C Output of the heat flux study

Processing was done by 10° squares. The computer program produced about 75 pages of listed output for each 10° square area. The listings for each square are contained in a separate volume identified by the Marsden number. Each volume is divided into three main sections. The first section summarizes the input parameters and data tables used in the analysis. Most of these have been described in the preceding section II.B and in Tables II - IX. A 1° sub-square regional assignment diagram is printed at the beginning of each volume. This chart shows the breakdown of the (up to) 10 regions by 1° subsquares within the larger 10° square. Most of the later volumes also contain the area (square meters) covered by each of the regions.

The second section summarizes the averages (sections II.C.1 and II.C.2 below) for selected environmental parameters and energy fluxes by month and by year. The third section is the seasonal region/wind sector summary, contained in section II.C.3 and II.C.4 below.

A fourth output of the program was a punched card file of the monthly averages. This file forms the basis for the subsequent climatological files, discussed in section III below. As of this writing, only the Atlantic Ocean monthly averages have been incorporated into the climatological files. The remaining 10° squares are still in punched card form and will be updated as time and money allow.

#### II.C.1 Monthly averages

Table X gives a summary of the variables output for the monthly and yearly averages. All variables are average values or are calculated using average values, over all valid observations in a month. The use of the estimated mean technique was made necessary by the large number of observations processed and the limited computer resources available at the time. This component of the output is also used in the climatological files (see section III below). Figure 4 contains an example of these averages.

$$a. \quad \bar{X}_m = X_e + \frac{1}{n_m} \sum_{i=1}^{n_m} (X_i - X_e)$$

where  $n_m$  is the number of valid observations for the month (output variable number 4)

$X_e$  is an estimated mean value unique for each variable.

- b. The Budyko heat flux terms are found using the assumptions outlined in section II.B.2.h. All the general terms used in the heat flux expressions are the average values as determined in II.C.1.a above. Table VIII is used in the calculation of  $Q_0$ . The mid-latitude of the region being summarized was used in the interpolation for a given month.

## II.C.2 Yearly averages

The variables output for the yearly averages are almost the same as those output for the monthly averages and are also described in Table X. For the yearly average, field three contains the coefficient of variation of the number of observations throughout the year. This is found using the following expression:

$$a. \quad \text{coefficient of variation} = 100.0 \left( \frac{1}{12} \sum_{m=1}^{12} (n_m - \bar{n})^2 \right)^{\frac{1}{2}} / \bar{n}$$

$$\text{where } \bar{n} = \frac{1}{12} \sum_{m=1}^{12} n_m$$

and  $n_m$  = the number of valid observations for a month.

- b. The frequency of rainfall is the number of observations which recorded precipitation divided by the total number of observations in the year.
- c. The remaining terms in the summary are found using the monthly averages weighted by the number of days per month. The results are then expressed as 30-day averages.

$$\bar{X}_Y = \sum_{m=1}^{12} (a_m \bar{X}_m) / \sum_{m=1}^{12} a_m$$

where  $\bar{X}_m$  is the monthly average

$$a_m = \frac{f(m)}{30}$$

and  $f(m)$  is the number of days in a given month for all months with valid observations.

- d. The wind direction is determined from the east and north components of the yearly average wind velocity as computed by II.C.2.c above.

The net result is that the number of observations has no effect on the yearly averages. The coefficient of variation (in field 3 of the annual summary) does give a measure of the distribution of observations over the year in order to facilitate the comparison of yearly averages. Figure 4 also contains an example of the summary of yearly averages.

### II.C.3 Seasonal region - wind sector summary

- a. Each valid observation is classified by a regional subdivision of the  $10^\circ$  square and by the wind sector, or direction from which the wind is blowing. All observations are further grouped by season of the year. Thus, all observations made in a season (e.g., January) over all years are grouped together. In this analysis, a season was defined for each month of the year and this assumption is implicit in the weighting factors defined below. Figure 5 is an example of this kind of output.

i Region assignment

Each Marsden square is divided into ten regions as specified by input to the program. These regions may assume any configuration and are composed of the  $1^\circ$  subsquares. The subsquares within a region may be discontinuous. Observations are assigned by subsquare identifier. Output is from Area 1 (top) to Area 10 (bottom).

ii Wind sector assignment

Observations are also categorized by the direction from which the wind is blowing. The wind sectors are broken down into four quadrants. A fifth sector is defined for those winds identified as variable or calm. Table III gives the wind sector definitions. Wind sector 6 is a summary of all observations (all wind sectors) by region.

- b. Variable definition. Table XI shows the variables and units which are summarized in the lists.

- i The mean values are found using the following expression

$$\bar{X} = X_e + \frac{1}{n_{aw}} \sum_{i=1}^{n_{aw}} (X_i - X_e)$$

where  $n_{aw}$  is the number of valid observations for the area wind sector category (output variable 3).

$X_e$  is an estimated mean value, unique for each variable.

- ii The appropriate standard deviation terms are found with the following expression.

$$SD = \left( \frac{1}{n_{aw}} \sum (X_i - X_e)^2 - (\bar{X} - X_e)^2 \right)^{\frac{1}{2}}$$

- iii The minimum and maximum values are simply the range of valid terms for a particular classification.

- iv The transport ratio is defined as follows:

$$\text{ratio} = \frac{\bar{W} \bar{q}_a}{\bar{W} \bar{q}_a}$$

where each mean is defined as in II.C.3.b.i above.

- v Budyko terms

The Budyko heat flux terms are found using the relationships outlined in section II.B.2.h. All the general terms used in the heat flux expressions are the average values as determined in II.C.3.b.i above. Table VIII is used in the calculation of  $Q_0$ . The mid-latitude of the region being summarized was used in the interpolation for a given month.

- vi The air density average output is as defined in section II.B.2.b. The calculation is a function of average values rather than being a calculated average density. Thus

$$\bar{\rho} = f(\bar{P}, \bar{\theta}_a, \bar{q}_a) \quad .$$

#### II.C.4 Annual summary

The final page contains selected parameters and the heat flux terms summarized over all the seasons. An example of this output is shown in Figure 6.

- a. The first part of the annual summary is broken down by regions of the  $10^\circ$  squares over all wind sectors (sector 6 is the total of sectors 1 through 5). All general terms are then calculated by the following expression for each subregion.

$$\bar{X}_{\text{annual}} = \frac{\sum_{i=1}^{12} b_i \bar{X}_{a6_i}}{\sum_{i=1}^{12} b_i}$$

where  $b_i = f(i)/30$

and  $f(i)$  is the number of days in a given month.

Again, the purpose here is to give all seasons over the year equal weight. The number of observations is given only for reference.

The Budyko heat flux terms are found using the above assumptions.

- b. The final line of the annual summary is the average over the entire  $10^\circ$  square. The method is similar to that described in section II.C.4.a, above, except that the seasonal average  $\bar{X}$  replaces the regional average  $\bar{X}_{a6}$ .

#### II.D Storage and access to heat flux volumes

The heat flux summaries are stored as a separate volume for each  $10^\circ$  square. Each volume is identified by Marsden number, latitude-longitude range, and sea. The volumes are currently stored in Clark Laboratory, Room 358. A sign-out sheet is located near the volumes. Please list your name, telephone extension, volume taken, date out and date returned.

### III. CLIMATOLOGICAL TIME SERIES

The climatological time series is a component of the WHOI/CASI archive which grew out of the heat flux study. The monthly averages of environmental parameters and fluxes have been organized into a time series for the years 1948 through 1972. The time series for each  $10^\circ$  square has been further processed to produce a statistical summary over a variety of seasonal time frames. The Atlantic Ocean climatology time series has been documented separately in WHOI-79-3 (see Reference 8). An initial analysis of the Atlantic Ocean climatology has been done by Bunker (9).

At the time of this writing, the processed climate files exist for only the Atlantic Ocean (see Figure 7). During the next phase of the climate study data for the Indian Ocean, Mediterranean, and Red Sea areas will be processed and incorporated into the archive.

#### III.A Storage and access to climatological data

The climatological component of the CASI archive is available in both printed and computer storage. The computerized data base has associated with it a variety of access and analysis software described briefly in section IV below.

##### III.A.1 Listed output

Both the time series of monthly averages and the seasonal statistics files are kept in volumes stored in Room 358 of Clark Laboratory. The monthly average files are divided into two volumes, one each for the North and South Atlantic. The seasonal statistics files are also separated, two volumes each for the North and South Atlantic. All  $10^\circ$  squares are identified by their Marsden reference number. A single separate volume contains both the time series averages and the seasonal statistics derived from the reports of ocean weather ships.

Because of the quantity of paper, there is only one copy of all volumes. Please try to leave all volumes in Room 358.

### III.A.2 Computer storage of climatological data

The time series of monthly averages, as well as the seasonal statistics, have all been stored for computerized retrieval. The contents and formats of these files are documented in Reference 8 so are only discussed briefly below.

#### a. Magnetic tape storage

The tape series (CL) for the climate study is currently being stored in the IPC computer center tape vault. It is recommended that you copy the required file onto your own tape or disc for subsequent processing. The climatological files are stored on the magnetic tape in several different formats. An index of the climatological tapes is in Room 358 of the Clark Laboratory.

#### b. Disc storage

At the time of this writing, most of the time series and seasonal statistics files are being stored on a private disc pack. Each  $10^6$  square is stored as a separate file. The naming conventions and format are compatible with the Xerox labelled tape storage formats. For extensive studies of the climatological data, it probably will be far more efficient to work from this disc, if available. The user may otherwise create his own disc and index file.

## IV COMPUTER SOFTWARE

The heat flux and climatology studies, as well as a variety of other projects, have initiated the development of numerous computer programs. These programs involve all components of the archive in both accessing and analysis functions. While it is not expected that the analysis programs will meet every researcher's requirements exactly, they may provide a base upon which modifications can be performed. Listed in the following sections are some of the software routines that have been developed or are currently available.

## IV.A Programs using TDF-11 observations

The following programs were developed to read and analyze observations from the TDF-11 series. While the programs have been developed for specific applications or areas, they could be adapted to work on other parameters of  $10^\circ$  squares.

ASHFLA-M	<p>A. Bunker IPC#7479 1974-5</p> <p>This program, in several versions including ASHFLA, performs the heat flux analysis described in section II above. A separate version of the program exists for <math>10^\circ</math> squares in the southern hemisphere.</p>
HEFLUVS	<p>A. Bunker IPC#7353 1973</p> <p>Computes the mean, standard deviation, minimum, maximum, and number of observations for various environmental parameters.</p>
ASHVSUM	<p>A. Bunker IPC#7541 1975</p> <p>An extension of program HEFLUVS to process more parameters.</p>
MARSAN 114	<p>Stommel/Fieux IPC#7342 1973</p> <p>Provides a (line printer) graphical and statistical summary of sea surface temperature for Marsden <math>10^\circ</math> square 114.</p>
AWASTAS	<p>M. Fieux IPC#7467 1974</p> <p>Graphical depiction of daily average wind velocity over a period of time.</p>
ARABSEA	<p>M. Fieux IPC#7437 1974</p> <p>A printed summary of the air and sea temperatures and wind velocity in the Arabian Sea.</p>
Air/Sea Wind Strees Analysis	<p>P. Saunders IPC#7504 1975</p> <p>Computes the time and geographic distribution of wind stress on the sea surface.</p>

WDETEMP                    W. Deuser    IPC#7573    1975  
 Computes the mean, standard deviation, and number of observations for Red Sea surface temperatures in 1° squares.

DISCOVER                   Bunker/Chaffee    IPC#U662    1976  
 Performs on-line entry of DISCOVERY data and conversion to TDF-11 format.

#### IV.B    Programs using heat flux study data

The following programs were developed to process the time series of monthly averages generated by the ASHFLA programs. In general, they are used to establish the data base for the ongoing climatology study.

ASHCONVERT                R. Goldsmith    IPC#U756    1977  
 Converts various ASHFLA formats to the Atlantic climatology (ACS) format.

POSWEIGHT                R. Goldsmith    IPC#U756    1977  
 Computes a weighted center of observations for a 10° square.

ACSEDIT                   A. Bunker    IPC#U756    1977  
 Creates a continuous time series of monthly average values.

ACSTOBIN                R. Goldsmith    IPC#U756    1977  
 Creates a binary format copy of the EBCDIC file created by program ACSEDIT.

IRUPDATE                A. Bunker    IPC#U756    1978  
 Creates a new time series file of monthly averages, correcting the heat flux terms for anomalous high altitude water vapor.

#### IV.C Programs associated with the climatology study

The study of the climatology of the Atlantic Ocean produced software in three basic categories. These are 1) library of data access routines, 2) utility processing routines, and 3) general analysis routines.

##### IV.C.1 Routines to access climatological data

STARTDAT	R. Goldsmith	IPC#U756	1977	Computes the number of months from some initial starting month.
ACSLABEL	R. Goldsmith	IPC#U930	1979	Retrieves parameter, units, and season labels.
ACSFILEINFO	R. Goldsmith	IPC#U756	1978	Retrieves file storage information from file index tables.
ACSDATAFILE	R. Goldsmith	IPC#U756	1977	Provides access to the time series of monthly averages.
ACSSTATFILE	R. Goldsmith	IPC#U756	1977	Provides access to the seasonal statistics files.

##### IV.C.2 Utility processing routines

ACSTREND	A. Bunker	IPC#U756	1977	This program is used to produce both the climatological seasonal summary files and the volumes of printed summaries.
ACSLOOK	R. Goldsmith	IPC#U930	1979	Allows an on-line user to extract data or statistical values.
PARLIST	A. Bunker	IPC#U756	1978	Produces a parameter listing of data values from the monthly averages file.

ACSDIF            A. Bunker    IPC#U756    1978  
Finds 10° squares with largest departures from local mean for selected parameters.

ACSSDORD        A. Bunker    IPC#U756    1978  
Orders the 10° squares by the seasonal standard deviation for a selected parameter.

ACSPLOT         A. Bunker    IPC#U756    1978  
Plots any selected parameter as a function of time for a 10° square data file.

ACSQPLOT        R. Goldsmith   IPC#U756    1978  
Provides plotting of time series data from an intermediate format.

ACSTRAM         A. Bunker    IPC#U930    1979  
Produces trend anomaly maps (line printer) for a selected parameter.

ACSMAP          A. Bunker    IPC#U756    1978  
Produces a plot of data, statistics, or anomalies over the Atlantic Ocean. The data may be optionally output in a format suitable for entry into the contouring routine OPCONT.

#### IV.C.3    General analysis routines

ACSTIMSAN       R. Goldsmith   IPC#U756    1978  
Selects and formats monthly averages of parameters for entry into the time series analysis (TIMSAN).

ACSBIGEIG       A. Bunker    IPC#U930    1979  
Computes the covariance matrix and eigenvalues for up to one hundred 10° squares.

ACSEIGAN        A. Bunker    IPC#U930    1979  
Analyzes the eigenvectors produced by ACSBIGEIG, and ranks the 10° squares by contribution.

ACSEIGAMP

R. Goldsmith IPC#U930 1979

Computes the eigenvector amplitude function.

TABLE VIIIb

Solar radiation received at the bottom of the atmosphere under cloudless conditions:  $Q_0 = f(m, \phi)$  where  $m$  is the month and  $\phi$  is the latitude. Converted to watts·meter<sup>-2</sup> from Reference 7.

For the Southern Hemisphere:

TABLE X.

Variable key for monthly and yearly averages.

## VARIABLE KEY FOR MONTHLY AND YEARLY AVERAGES

FIELD NO.	IDENTIFIER	DESCRIPTION	UNITS
1	MS	• MARSDEN SQUARE NUMBER	
2	YEAR	• YEAR	
3	MONTH	• MONTH	
	VAR	• ANNUAL % VARIATION OF MONTHLY OBS	
4	OBS	• NUMBER OF OBSERVATIONS	
5	TA	• AVERAGE AIR TEMPERATURE	(C)
6	MXR	• AVERAGE MIXING RATIO	(G/KG)
7	TS	• AVERAGE SEA SURFACE TEMPERATURE	(C)
8	TASD	• AVERAGE AIR-SEA TEMPERATURE DIFFERENCE	(C)
9	N	• AVERAGE TOTAL CLOUD COVER	(OKTAS)
10	W	• AVERAGE WIND SPEED	(M/SEC)
11	U	• AVERAGE X WIND VELOCITY	(M/SEC)
12	V	• AVERAGE Y WIND VELOCITY	(M/SEC)
13	MD	• MEAN DIRECTION OF RESULTANT WIND	(FROM 0 NORTH)
14	RRAT	• RATIO OF RAIN TO TOTAL OBS	
15	P	• AVERAGE PRESSURE	(PASCALS)/100
16	SIRAT	• RATIO OF SEA ICE OBS TO TOTAL OBS	
		USING BUDYKO METHOD	
17	G(1+ALB)	• AVERAGE RADIATION AT SURFACE	(WATTS/METER**2)
18	IR	• AVERAGE EFFECTIVE INFRARED	(WATTS/METER**2)
19	R	• AVERAGE RADIATIONAL EXCHANGE	(WATTS/METER**2)
20	LE	• AVERAGE LATENT HEAT FLUX	(WATTS/METER**2)
21	SE	• AVERAGE SENSIBLE HEAT FLUX	(WATTS/METER**2)
22	A(B)	• AVERAGE NET HEAT GAIN BY OCEAN	(WATTS/METER**2)
		USING OBSERVATIONS	
23	LE	• AVERAGE LATENT HEAT FLUX	(WATTS/METER**2)
24	SE	• AVERAGE SENSIBLE HEAT FLUX	(WATTS/METER**2)
25	A(B,I)	• AVERAGE NET HEAT GAIN BY OCEAN	(WATTS/METER**2)
26	TAUX	• AVERAGE STRESS IN X DIRECTION	(PASCALS)
27	TAUY	• AVERAGE STRESS IN Y DIRECTION	(PASCALS)

TABLE XI.

Variable key for seasonal summaries by region and sector

## VARIABLE KEY FOR SEASONAL SUMMARIES BY AREA AND SECTOR

FIELD NO.	IDENTIFIER	DESCRIPTION	UNITS
1	MS	- MARSDEN SQUARE	
2	MONTH	- MONTH	
3	NBS	- NUMBER OF OBSERVATIONS	
4	TA	- AVERAGE AIR TEMPERATURE	(C)
5	SD	- STANDARD DEVIATION OF AIR TEMPERATURE	(C)
6	MIN	- MINIMUM AIR TEMPERATURE	(C)
7	MAX	- MAXIMUM AIR TEMPERATURE	(C)
8	TD	- AVERAGE DEW POINT	(C)
9	SD	- STANDARD DEVIATION OF DEW POINT	(C)
10	MIN	- MINIMUM DEW POINT	(C)
11	MAX	- MAXIMUM DEW POINT	(C)
12	TS	- AVERAGE SEA TEMPERATURE	(C)
13	SD	- STANDARD DEVIATION OF SEA TEMPERATURE	(C)
14	MIN	- MINIMUM SEA TEMPERATURE	(C)
15	MAX	- MAXIMUM SEA TEMPERATURE	(C)
16	TASD	- AIR-SEA TEMPERATURE	(C)
17	SD	- STANDARD DEVIATION OF AIR-SEA TEMPERATURE	(C)
18	MIN	- MINIMUM AIR-SEA TEMPERATURE	(C)
19	MAX	- MAXIMUM AIR-SEA TEMPERATURE	(C)
20	NT	- AVERAGE TOTAL CLOUD COVER	(OKTAS)
21	NL	- AVERAGE LOWER CLOUD COVER	(OKTAS)
22	MXR	- AVERAGE MIXING RATIO	(G/KG)
23	MXRS	- AVERAGE MIXING RATIO OVER SEA	(G/KG)
24	PRES	- AVERAGE PRESSURE	(PASCALS)/100
25	SD	- STANDARD DEVIATION OF PRESSURE	(PASCALS)/100
26	MIN	- MINIMUM PRESSURE	(PASCALS)/100
27	WS	- AVERAGE WIND SPEED	(M/SEC)
28	SD	- STANDARD DEVIATION OF WIND SPEED	(M/SEC)
29	MAX	- MAXIMUM WIND SPEED	(M/SEC)
30	U	- AVERAGE X WIND COMPONENT	(CM/SEC)
31	SD	- STANDARD DEVIATION OF X WIND	(CM/SEC)
32	V	- AVERAGE Y WIND COMPONENT	(CM/SEC)
33	SD	- STANDARD DEVIATION OF Y WIND	(CM/SEC)
34	MD	- MEAN DIRECTION OF THE WIND	(DEGREES FROM 0 NORTH)
35	R/NR	- RATIO OF RAIN TO TOTAL OBS	
36			
		USING BLDYKO METHOD	
37	G(1-ALB)	- AVERAGE RADIATION AT SURFACE	(WATTS/METER**2)
38	IR	- AVERAGE EFFECTIVE INFRA-RED	(WATTS/METER**2)
39	R	- AVERAGE RADIATIONAL EXCHANGE	(WATTS/METER**2)
40	LE	- AVERAGE LATENT HEAT FLUX	(WATTS/METER**2)
41	SE	- AVERAGE SENSIBLE HEAT FLUX	(WATTS/METER**2)
42	A(B)	- AVERAGE NET HEAT GAIN BY OCEAN	(WATTS/METER**2)
		USING OBSERVATIONS	
43	LE	- AVERAGE LATENT HEAT FLUX	(WATTS/METER**2)
44	SE	- AVERAGE SENSIBLE HEAT FLUX	(WATTS/METER**2)
45	A(B,I)	- AVERAGE NET HEAT GAIN BY OCEAN	(WATTS/METER**2)
46	TAUX	- AVERAGE STRESS IN X DIRECTION	(PASCALS)
47	TAUY	- AVERAGE STRESS IN Y DIRECTION	(PASCALS)
48	CE	- EXCHANGE COEFFICIENT (*1000)	
49	A*G/*G	- TRANSPORT RATIO	
50	RHO	- AIR DENSITY F(4,22,24)	(KG/M**3)
51	A(E)*AREA	- TOTAL HEAT GAIN BY OCEAN	(WATTS)/10**12
52	A(B,I)*AREA	- TOTAL HEAT GAIN BY OCEAN	(WATTS)/10**12

APPENDIX A - National Climatic Center surface marine observations  
TDF-11 documentation.

TAPE DECK		PAGE NO.
TDF-11	SURFACE MARINE OBSERVATIONS	i
<u>INTRODUCTION</u>		
<u>SOURCE</u>		
<p>Tape Data Family - 11 was derived from a variety of punched card decks. Observations were obtained from Ship Logs, Ship Weather Reporting Forms, published Ship Observations, Automatic Observing Bouys, Teletype Reports, and on cards purchased from several foreign Meteorological Services.</p>		
<p>The quality of instruments ranges from those found aboard a 19th century Whaling Ship to the most sophisticated electronic equipment used on today's Ocean Weather Ships. Observer qualifications vary from Deck Hand to trained Meteorologist.</p>		
<p>From this conglomeration, an effort was made to bring to the researcher of oceanic weather patterns and sea conditions, a common observational format, designed for use with modern electronic data processing equipment. The International Marine punched card (Deck 128), established in 1963, was used as the basic input format to Tape Data Family - 11. Some modifications were made so that previously recorded observations could become an integral part of this Family.</p>		
<u>QUALITY CONTROL AND CODE CONVERSIONS</u>		
<p>The starting point for programming was the individual card deck. No attempt was made to "second guess" conversion or coding procedures employed in punching each of the various decks. This did lead to instances of double conversions. ie: Elements converted from the 1929 to the 1942 codes for punching, were then converted to the current codes for inclusion in the tape.</p>		
<p>All conversion procedures used were devised or reviewed by professional meteorologists. Occasionally it was necessary to resort to subjective conversions based on observational experience as well as knowledge of instruments and observing techniques.</p>		
<p>In cases where it was felt that elements were acceptable for conversion without significant loss of resolution, the new values were placed in the common portion of the observation. Elements or meteorological phenomena which did not lend themselves to conversion were retained in the supplemental portion of the observation.</p>		
<p>During the taping, additional quality control checks were made. These checks flagged or rejected observations that did not meet specified conditions or limits. Extreme temperatures were established for each Marsden Square and individual observations were compared against these limits. Pressures were also checked against a set of extreme values. Ship positions had to be in ocean, sea, or lake areas. Wind directions, visibility, weather, sea conditions etc. had to be valid punches as defined by each card deck.</p>		
<u>USE OF THE MANUAL</u>		
<p>This manual was designed so that recourse to additional reference material should be unnecessary. Occasionally, however, the researcher may wish to obtain a copy of the original Card Deck reference manual. This may be done by writing to the Director, National Weather Records Center, Asheville, North Carolina.</p>		
<p>Care should be taken to read carefully the statements pertaining to observational quality, general tape notations, common coding practices and conversion procedures used for the individual decks.</p>		

TAPE DECK		PAGE NO.
TDF-11	SURFACE MARINE OBSERVATIONS	ii
<p data-bbox="329 279 477 300"><u>THE DATA FILE</u></p> <p data-bbox="329 321 1354 548">Over 31 million Surface Marine observations are currently in Tape Data Family - 11. They are filed by 10<sup>0</sup> Marsden Square, Year, Month without regard to individual deck number. ie: All observations for January 1962 in Marsden Square 051 would be found together, followed by all observations for February 1962 etc. The period 1800- June,1968 is held on 293 reels of 9 channel, 800 bpi tape. It is not anticipated that future acquisitions will be merged into this group, but will be placed on tape in the TDF-11 format and retained as a separate file.</p> <p data-bbox="329 573 1365 732">Observations from Ocean Weather Stations were placed in the TDF-11 format but not merged into the common file mentioned above. Currently operating Weather Ships are kept, individually, by station number (See Tape Field 029), while those ships no longer actively reporting have been filed together. Observations are filed by Ocean Weather Station number, Year, Month. These reports were also taken from a variety of card decks.</p> <p data-bbox="329 753 1344 810">Funding for the development of TDF-11 was provided jointly by the Naval Weather Service Command, the Environmental Science Services Administration, and the Department of Defense.</p>

TDF-11	SURFACE MARINE OBSERVATIONS	iii

SPECIAL NOTE

Although every effort was made to assure conformity, the user is cautioned that discrepancies in original punching procedures and conversion schemes occasionally occurred. Validity checks should be applied to all elements as they are used.

Reporting practices for individual decks sometimes varied during the applicable period. It must not be assumed that all elements are available for each observation. For example: A specific deck may report Present Weather for only 15 years out of a 40 year period of record. Documentation of these vagaries was not sufficient enough to allow us to include such items in this manual.

Not all ships changed their reporting practices to conform to the codes effective January 1, 1968, on that date. In many cases it was impossible to determine whether the new or old codes were being reported. This situation continued for the first few months of 1968. The Wave and Swell groups, in particular, should be examined closely during this period.

TAPE DECK		PAGE NO.
TDF-11	SURFACE MARINE OBSERVATIONS	iv
<u>MANUAL AND TAPE NOTATIONS</u>		
<u>FORMAT</u>		
<p>Each observation is 140 characters in length. Positions 001-082 and 89-93 are common to all decks. Positions 083-088 vary according to the indicator found in position 082. Positions 094-140 are reserved for Supplemental Data and may be different for each deck. Because of the wide variety of elements and coding vagaries inherent in the Supplemental Data Fields, it is expected that most users will restrict themselves to working with the common portion of the observations.</p>		
<p>For quick reference, each element or group of similar elements is identified by a Field Number. Thus, Fields 001-032 and 037-038 are common to all decks, Fields 033-036 vary according to the indicator found in Field 032, and Fields 039-onward are reserved for Supplemental Data.</p>		
<p>The manual consists of five basic parts:</p>		
<ol style="list-style-type: none"> <li>1. General Information</li> <li>2. The Standard Format with definitions of Tape Fields and Positions</li> <li>3. The basic codes used for all elements in the common portion of the observations</li> <li>4. Explanations of Unique Characteristics, Conversion Procedures and Supplemental Data Fields by individual deck</li> <li>5. General coding practices, conversions and formulae used during the conversion from cards to tape. (Section 4).</li> </ol>		
<p>When an element is shown as being available but no conversion procedure is noted - the codes were deemed compatible and the punched values transferred directly to the tape.</p>		
<u>TAPE</u>		
<p>The following notations are used throughout the manual:</p>		
<p>x = any numeric digit or alpha numeric character</p>		
<p>i = same as x but used to show that the character is an indicator rather than part of the recorded element</p>		
<p>- = an "11" punch in the card or the equivalent tape configuration</p>		
<p>+ = a "12" punch in the card or the equivalent tape configuration. Both the - and + may appear by themselves or in combination with a numeric digit to indicate an overpunch or signed tape field.</p>		
<p>Δ = Blank - no card punch or blank configuration on tape</p>		
<p>Low order = Rightmost position of a field</p>		
<p>High order = Leftmost position of a field</p>		
<p>When elements were not reported, not readily convertible to the common portion, or did not pass the various quality control checks, the respective tape positions in the common portion appear as blanks.</p>

				8 =	6500-7999 2000-2499
				9 =	> 8000 or > 2500 or no clouds no clouds
022	66	MIDDLE CLOUD TYPE (C <sub>M</sub> )	0-9, -	0 = No altostratus, Altostratus or Nimbostratus.	
				1 = Altostratus, the greater part of which is semi-transparent; through this part the sun or moon may be weakly visible, as through ground glass.	
				2 = Altostratus, the greater part of which is sufficiently dense to hide the sun or moon, or Nimbostratus.	
				3 = Altocumulus, the greater part of which is semi-transparent; the various elements of the cloud change only slowly and are all at a single level.	
				4 = Patches (often in the form of almonds or fishes) of Altocumulus, the greater part of which is semi-transparent; the clouds occur at one or more levels and the elements are continually changing in appearance.	
				5 = Semi-transparent Altocumulus in bands, or Altocumulus in one or more fairly continuous layers (semi-transparent or opaque), progressively invading the sky; these Altocumulus clouds generally thicken as a whole.	
				6 = Altocumulus resulting from the spread- ing out of Cumulus (or Cumulonimbus).	
				7 = Altocumulus in two or more layers, usually opaque in places, and not progressively invading the sky; or opaque layer of Altocumulus, not progressively invading the sky; or Altocumulus together with Altostratus or Nimbostratus.	
				8 = Altocumulus with sproutings in the form of small towers or battlements; or Altocumulus having the appearance of cumuliform tufts.	
				9 = Altocumulus of a chaotic sky, general- ly at several levels.	
				- = Altocumulus, Altostratus and Nimbostratus invisible owing to dark- ness, fog, blowing dust or sand or other similar phenomena, or more often because of the presence of a continuous layer of lower clouds.

TDF-11	SURFACE MARINE OBSERVATIONS	SECTION 4.1

SECTION 4

CONVERSION SCALES

SCALE 1      Conversion of Octant to Quadrant (Tape Field 004).

Octant = 0 (00-90°N, 00-90°W)	Quadrant = 1
Octant = 1 (00-90°N, 90-180°W)	Quadrant = 1
Octant = 2 (00-90°N, 90-180°E)	Quadrant = 2
Octant = 3 (00-90°N, 00-90°E)	Quadrant = 2
Octant = 5 (00-90°S, 00-90°W)	Quadrant = 3
Octant = 6 (00-90°S, 90-180°W)	Quadrant = 3
Octant = 7 (00-90°S, 90-180°E)	Quadrant = 4
Octant = 8 (00-90°S, 00-90°E)	Quadrant = 4

SCALE 2      Conversion of Local Standard Time to GMT (Tape Field 010).

Starting at 008°W and working westward in 15° increments, one hour was added to the LST for each 15° of Longitude through 180°.

For example: 1 hour was added for longitudes 008°-022°W  
2 hours were added for longitudes 023°-037°W  
etc.

Starting at 008°E and working eastward in 15° increments, one hour was subtracted from the LST for each 15° of Longitude through 180°.

For example: 1 hour was subtracted for longitudes 008°-022°E  
2 hours were subtracted for longitudes 023°-037°E  
etc.

SCALE 3      Conversion of 1942 present weather code to 1960 present weather code (Tape Field 014)

<u>1960 Code (Taped)</u>	<u>1942 Code</u>	<u>1942 Code Definition</u>
ΔΔ	00-03	State of the sky (not converted to tape)
04	17	Visibility reduced by smoke
05	05	Haze (Visibility 1000 meters or more)
08	06	Dust devils seen
09	12	Duststorm within sight but not at ship
10	08	Light fog (Visibility 1000-2000 meters)
12	40	Fog
13	07	Distant lightning
16	10	Precipitation within sight
17	11	Thunder, without precipitation at the ship
18	14	Squally weather
18	15	Heavy squalls in last three hours
19	16	Waterspouts seen in last three hours
20	20	Precipitation      Within past hour but not at observation
20	21	Drizzle      "
21	22	Rain      "
22	23	Snow      "
23	24	Rain and snow mixed      "
25	25	Rain shower      "
26	26	Snow shower      "
27	27	Hail or rain and hail showers      "
28	41	Moderate fog      "
29	28	Slight thunderstorm      "
29	29	Heavy thunderstorm      "

	24	82	
	33	88	

Did not have comparable definitions and will not appear on tape when Field 014 was derived by Scale 3.

TAPE DECK		PAGE NO.
TDF-11	SURFACE MARINE OBSERVATIONS	SECTION 4.4

SECTION 4

CONVERSION SCALES

SCALE 4      Computation of Wet Bulb Temperature (Tape Field 018).  
(Air Temperature 0°F and above)

$$T_{wb} = T - (.034N - .00072N \{N-1\}) (T + T_{dp} - 2P + 108)$$

Where:     $T_{wb}$  = Wet Bulb Temperature in °F  
            $T$  = Dry Bulb Temperature in °F  
            $T_{dp}$  = Dew Point Temperature in °F

$$N = \frac{T - T_{dp}}{10}$$

$$P = 29.90 \text{ inches of mercury}$$

Where necessary, Celsius temperatures were converted to Fahrenheit temperatures before the computation was made.

Because of conversion procedures, computed wet bulb temperatures occasionally exceeded the dry bulb temperature. When the computed wet bulb temperature exceeded the dry bulb temperature by one degree Celsius or less, the temperatures were considered equal and Tape Field 018 entered to equal Tape Field 017. Wet bulb temperatures exceeding the dry bulb temperature by more than one degree Celsius were considered invalid and Tape Field 018 is blank.

SCALE 5      Conversion of Beaufort Wind Force to Knots (Tape Field 012).

<u>Tape Entry</u>	<u>Beaufort Wind Force</u>	<u>Beaufort Limits in Knots</u>
000	0	Calm
002	1	1 - 3
005	2	4 - 6
009	3	7 -10
013	4	11-16
018	5	17-21
024	6	22-27
030	7	28-33
037	8	34-40
044	9	41-47
052	10	48-55
062	11	56-63
068	12	64 or greater

SCALE 6      Computation of Fahrenheit temperatures to Celsius Temperatures (Tape Fields 017,018,019,020)

$$^{\circ}\text{C} = (^{\circ}\text{F} - 32) (.55555)$$

The resultant Celsius temperature was rounded to the nearest tenth before placing in the appropriate tape field.

TAPE DECK		PAGE NO.
TDF-11	SURFACE MARINE OBSERVATIONS	SECTION 4.5

SECTION 4  
CONVERSION SCALES

SCALE 7      Conversion of Cloud Amounts from tenths of sky covered to eighths of sky covered  
(Tape Field 022 (N), (N<sub>h</sub>) ).

<u>Tape Entry (Oktas)</u>	<u>Tenths</u>
0	0
1	1
2	2 or 3
3	4
4	5
5	6
6	7 or 8
7	9
8	10
9	Obscured

SCALE 8      Computation of Dew Point Temperature (Tape Field 019).

When RH = 40% or more:

$$T - T_{dp} = (14.55 + .114T)x + ((2.5 + .007T)x)^3$$

When RH = Less than 40%:

$$T - T_{dp} = (14.55 + .114T)x + ((2.5 + .007T)x)^3 + (15.9 + .117T)x^{14}$$

Where:     $T_{dp}$  = Dew Point Temperature in °C  
               $T$  = Dry Bulb Temperature in °C  
               $x$  = 1.0 - RH

20. ABSTRACT (Continue on reverse side if necessary and identify by block number)  Scientists at Woods Hole routinely collect and analyze a considerable amount of data relating to the oceans of the world. Of the many different kinds of data, one particular subset concerns those events occurring at the sea surface. A large number of sea surface environmental observations have been collected at Woods Hole. These data, and the subsequent analyses generated from the Air/Sea Heat Flux and the Climatology study projects, have been collected and archived. This document describes the (Cont. on back)

Woods Hole Oceanographic Institution WHOI-79-70	<p>WOODS HOLE OCEANOGRAPHIC INSTITUTION COLLECTION OF CLIMATOLOGY AND AIR/SEA INTERACTION (CAST) DATA by Roger A. Goldsmith and Andrew F. Bunker. 75 pages. August 1979. Prepared for the Office of Naval Research under Contract N00014-74-C-0262; NR 083-004 and for the National Science Foundation (Climate Dynamics Program, Atmospheric Sciences Division) under Grant ATM 77-01475.</p> <p>Scientists at Woods Hole routinely collect and analyze a considerable amount of data relating to the oceans of the world. Of the many different kinds of data, one particular subset concerns those events occurring at the sea surface. A large number of sea surface environmental observations have been collected at Woods Hole. These data, and the subsequent analyses generated from the Air/Sea Heat Flux and the Climatology study projects, have been collected and archived. This document describes the W.H.O.I./Climatology and Air/Sea Interaction (WHOI/CAST) data collection and provides an initial index to its various components.</p>	<p>1. Climatology</p> <p>2.
